

Earth Interior

UPSC Geography Quick Notes

Basic sequence: Crust, Mantle, Outer Core, Inner Core.

Crust: The outermost solid layer. Continental crust is generally thicker and less dense, while oceanic crust is thinner and denser.

Mantle: A thick silicate-rich layer below the crust. Mantle convection is closely associated with plate tectonics and the movement of lithospheric plates.

Outer Core: Predominantly iron and nickel in a liquid state. Motion of conducting material in the outer core is associated with Earth's magnetic field.

Inner Core: Predominantly iron and nickel in a solid state because of extremely high pressure.

UPSC Focus

Layer	Key feature
Crust	Outermost solid layer
Mantle	Thick silicate-rich layer; convection
Outer Core	Liquid metallic layer
Inner Core	Solid metallic layer
